

Family MESOPHANTASMATIDAE

The family Mesophantasmataidae was erected by Rohdendorf (1962) for the single specimen of *Mesophantasma tipuliforme* Rohdendorf from the Upper Jurassic Karatau deposits of Kazakhstan. The type specimen is represented by only the left wing and has many parts of its venation obscured. Many of the veins and crossveins illustrated by Rohdendorf are guesses and are in reality not visible in the type specimen.

Rohdendorf (1964) placed the family in its own Superfamily Mesophantasmataidea near the Protendipedidae.

Genus MESOPHANTASMA Rohdendorf

MESOPHANTASMA Rohdendorf, 1962: 319 (1991: 462). Type species: *Mesophantasma tipuliforme* Rohdendorf, 1962, by original designation.
tipuliforme Rohdendorf, 1962: 319 (1991: 462). PA: Kazakhstan (Upper Jurassic) [C].
