

Family PROTOLIGONEURIDAE

Rohdendorf (1962) proposed the genus Protoligoneuridae based on the single species *Protoligoneura fusicosta* from the Lower Jurassic deposits of Issyk-Kul', Kirghizistan. Rohdendorf (1964) placed the family in the Bibionomorpha. However, the closed anal cell indicates that the family may not be nematocerous if Rohdendorf's depiction of the venation is correct. It is provisionally retained here in the Nematocera until such time as the type material can be reexamined.

Ref.: Rohdendorf (1964, review and classification).

Genus PROTOLIGONEURA Rohdendorf

PROTOLIGONEURA Rohdendorf, 1962: 319 (1991: 463). Type species: *Protoligoneura fusicosta* Rohdendorf, 1962, by original designation.

fusicosta Rohdendorf, 1962: 319 (1991: 463). PA: Kirghizistan (Lower Jurassic) [C].
