

Family PSEUDOPOMYZIDAE

The Pseudopomyzidae are a little-known family of acalypterate flies, which previously have included the genera of Cypselosomatidae. Extant taxa are known from every zoogeographical region except the Afrotropical. Very little is known of their biology. Adults of extant forms have been found in banana bait traps and have been reared from larvae found under bark.

The fossil record is bleak. Only one species has been recorded from Baltic amber.

Genus EOPSEUDOPOMYZA Hennig

EOPSEUDOPOMYZA Hennig, 1971 c: 7. Type species: *Eopseudopomyza kuehni* Hennig, 1971, by monotypy.

kuehni Hennig, 1971 c: 7. PA: Baltic Region (Eocene/Oligocene) [A].
