

A CATALOG OF THE EPHEMEROPTERA OF THE PHILIPPINES¹

By Michael D. Hubbard and Manuel L. Pescador²

Abstract: The Ephemeroptera known from the Philippines are listed, with references to literature and information on types and type localities included for each species. A bibliography of works pertaining to Philippine Ephemeroptera is included.

At present there are only about 20 species of mayflies described from the Philippines. This is not by any means a reflection of a paucity of species of mayflies in the area, but is due to the fact that, until now, collections in this region have been very few and sporadic. Despite the limited number of species described, the literature references are so scattered and difficult to locate that we thought it advisable to assemble them into 1 source to aid people interested in working with the mayfly fauna of this region and to encourage others to continue to work in this area. A bibliography of references treating this fauna follows the catalog.

In the catalog which follows, each species of Ephemeroptera known from the Philippines is listed with citations of references pertaining to them. Bracketed information following each citation for a species indicates the kind of information the reference contains. The following terms are used:

♂, ♀—sex of the adult mentioned in the reference

nym.—nymph stage mentioned in reference

des.—a description or descriptive material is contained in reference

fig.—reference contains a figure or plate illustrating the species

key—the species is contained in a key

type—information on the type or types is provided (i.e., sex, type-locality, depositories of type material)

The following abbreviations are used for museums containing types of Philippine Ephemeroptera: (BMNH) British Museum of Natural History, London; (BRUXELLES) Bruxelles Museum, Bruxelles; (FMNH) Field Museum of Natural History, Chicago; (HAMBURG) Zoologisches Museum der Universität, Hamburg.

FAMILY BAETIDAE

GENUS *Cloeon* Leach
