

TWO NEW SPECIES OF *SCHOUTEDENICHIA* (ACARI: TROMBICULIDAE) FROM A SHREW (INSECTIVORA) IN TANZANIA, EAST AFRICA¹

M. Lee Goff²

Abstract. *Schoutedenichia tanzaniaensis* and *Schoutedenichia discalis* are described as new from specimens collected from a single shrew, *Crocidura* sp., taken in Tanzania, East Africa.

Jadin & Vercammen-Grandjean (1954) proposed the genus *Schoutedenichia* with *Schoutedenichia fulleri* Jadin & Vercammen-Grandjean, 1954, as the type-species. Vercammen-Grandjean (1958) revised the genus and listed 41 species and subspecies. Subsequently, Taufflieb (1960, 1961, 1966) described 7 additional species in the genus, all from Africa. Examination of material collected from a single individual shrew collected on the campus of the University of Dar Es Salaam, Tanzania, has revealed 2 additional species, described below. Holotypes are in the B.P. Bishop Museum (BPBM) and paratypes are there and in the collection of the U.S. National Museum of Natural History/Smithsonian Institution (chigger collection currently housed at Bishop Museum). All measurements are given in micrometres. Terminology follows Goff et al. (1982).

Schoutedenichia tanzaniaensis Goff, new species

Fig. 1

Description of species. Larva. *Idiosoma.* Measuring 385 × 250 in engorged specimen. Eyes 1/1, free on cuticle. 1 pair of humeral setae, measuring 27–29; 52 dorsal idiosomal setae, measuring 18–21; arranged 8-14(10+4)-10-6-6-2; 2 pairs of sternal setae, anterior 25–29, posterior 18–21; 26 preanal setae, 13–15; 26 postanal setae, 17–20; total idiosomal setae 110. *Gnathosoma.* Palpal setal formula B/N/NNB/4B; palpal claw 3-pronged; galeala N; cheliceral blade (22–23) with tricuspid cap; gnathobase lightly punctate, bearing a pair of branched setae. *Scutum.* Lightly punctate with biconcave anterior margin; posterior margin biconvex; intersensillary craters present slightly posterior to level of AL bases; AM base in line with or slightly posterior to level of AL bases; SB anterior to level of PL bases; AM = PL > AL; PW/SD = 1.80–2.02; sensillae clavate, head with coarse setules. Scutal measurements of holotype followed by means and ranges of type series in parentheses: AW 52 (52, 49–55); PW 79 (78, 75–83); SB 38 (38, 36–40); ASB 21 (22, 21–24); PSB 19 (19, 17–20); AP 37 (37, 35–40); AM 26 (27, 24–28); AL 19 (19, 16–20); PL 25 (26, 22–29); sens. 31 × 12 (32 × 11, 31–33 × 11–12). *Legs.* All 7-segmented, terminating in a pair of claws and a clawlike empodium. Onychotriches

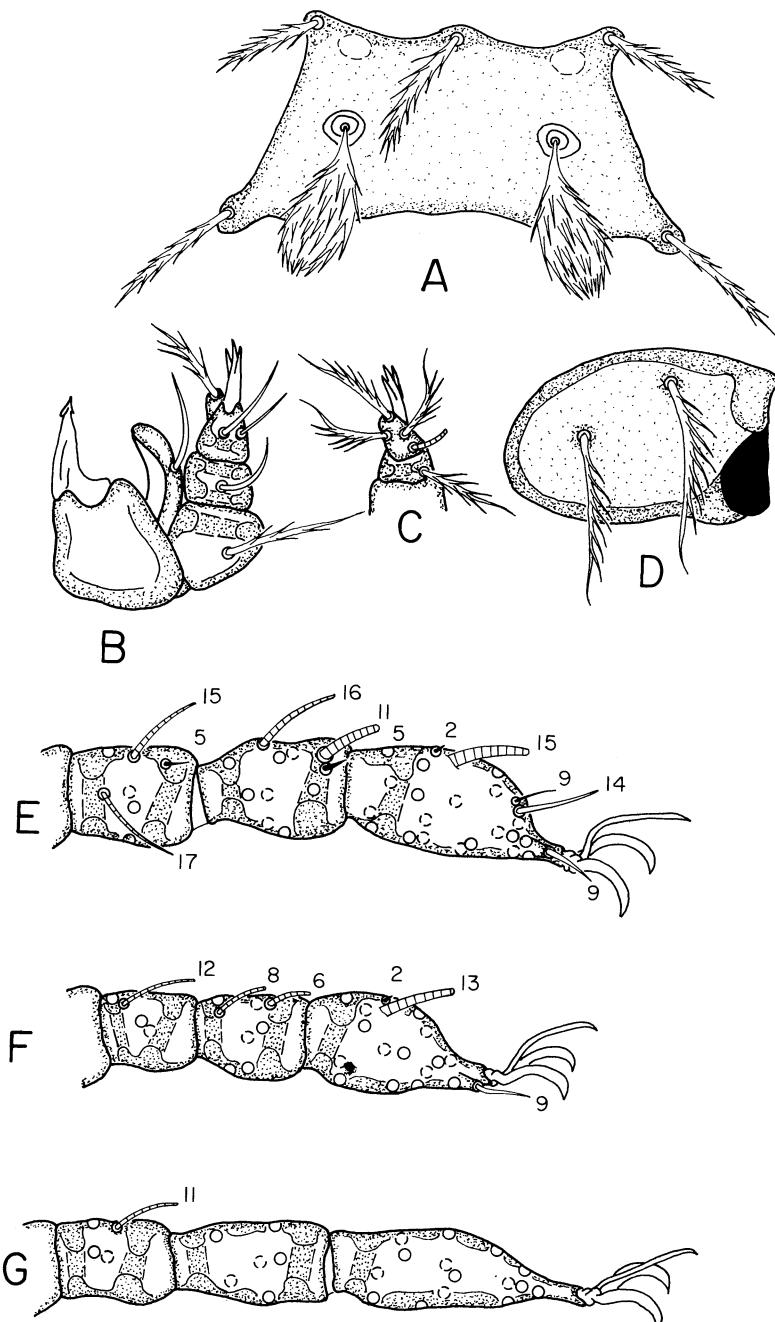

FIG. 1. *Schoutedenichia tanzaniaensis*: **A**, scutum; **B**, dorsal aspect of gnathosoma; **C**, ventral aspect of palpal tibia and tarsus; **D**, coxa III; **E**, leg I distal 3 segments showing specialized setae (measurements in micrometres) and bases of branched setae; **F**, leg II as above; **G**, leg III as above.

absent. IP 568–585. *Leg I.* 196–207; coxa with 1 branched seta (1B); trochanter 1B; basifemur 1B; telofemur 5B; genu 4B, 2 genualae (σ), microgenuala (k); tibia 8B, 2 tibialae (ϕ), microtibiala (k); tarsus (42 \times 18) 20B, tarsala (15–16) (ω), microtarsala (e), subterminala (ζ), para-subterminala, pretarsala (ζ). *Leg II.* 171–177; coxa 1B; trochanter 1B; basifemur 2B; telofemur 4B; genu 3B, genuala (σ); tibia 6B, 2 tibialae (ϕ); tarsus (38 \times 17) 15B, tarsala (13–14) (ω), microtarsala (e), pretarsala (ζ). *Leg III.* 197–206; coxa 2–3B; trochanter 1B; basifemur 2B; telofemur 3B; genu 3B, genuala (σ); tibia 6B; tarsus (48 \times 14) 14B.

Type data. Holotype (BPBM 12,770) and 7 paratypes, TANZANIA: Dar Es Salaam, University of Dar Es Salaam campus, ex *Crocidura* sp., 2.XII.1980 (D.M. Howell).

Remarks. *Schoutedenichia tanzaniaensis* resembles 2 other African species described by Vercammen-Grandjean (1958), *S. morosi* and *S. kivuensis*. *S. tanzaniaensis* may be separated from *S. morosi* in having palpal setation B/N/NNB/4B (B/B/NNB/4B for *S. morosi*), AL < AM (AL > AM in *S. morosi*), eyes 1/1 (2/2 in *S. morosi*) and 52 dorsal idiosomal setae arranged beginning 8-14(10+4)-10 (62 arranged 8-8-8-6-8-... in *S. morosi*). *S. tanzaniaensis* may be distinguished from *S. kivuensis* by palpal setation (N/N/NNN/4B in *S. kivuensis*), number of dorsal idiosomal setae (74, arranged 6-10-10-8 in *S. kivuensis*) and coxa III normally 2B (3B in *S. kivuensis*). In 1 specimen of *S. tanzaniaensis*, coxa III was 3B on one side. All other specimens were uniformly 2B. The species name is based on the type-locality.

***Schoutedenichia discalis* Goff, new species**

Fig. 2

Description of species. Larva. *Idiosoma.* Measuring 285 \times 205 in engorged specimen. Eyes 2/2, of equal size, on ocular plate. 1 pair of humeral setae, measuring 33–38; 52 dorsal idiosomal setae, measuring 21–41, anterior setae longest, arranged 6-6-8-8-10-8-4-2; 2 pairs of sternal setae, anterior 25–27, posterior 22; 38 preanal setae, 17–23; 16 postanal setae, 24–26; total idiosomal setae 112. Humeral and dorsal idiosomal setae inserted on circular plates, 7–12 diam, other idiosomal setae free on cuticle. *Gnathosoma.* Palpal setal formula B/B/BBB/4B; palpal claw 3-pronged; galeala B; cheliceral blade (29) with tricuspid cap; gnathobase lightly punctate, bearing a pair of branched setae. *Scutum.* Lightly punctate with sinuous anterior margin; posterior margin shallowly biconvex; AM base slightly posterior to or in line with AL bases; SB anterior to level of PL bases; PL > AL = AM; PW/SD = 1.56–1.78; sensillae clavate, head with coarse setules. Scutal measurements of holotype followed by means and ranges of type series in parentheses: AW 50 (48, 44–51); PW 84 (81, 75–85); SB 37 (36, 35–37); ASB 26 (27, 25–29); PSB 21 (22, 21–23); AP 39 (38, 37–39); AM 28 (28, 26–29); AL 24 (26, 24–29); PL 39 (41, 39–43); sens. 32 \times 11 (33 \times 11, 32–35 \times 10–11). *Legs.* All 7-segmented, terminating in a pair of claws and a clawlike empodium. Onychotriches absent. IP 601–619. *Leg I.* 212–214; coxa 1B; trochanter 1B; basifemur 1B; telofemur 5B; genu 4B, 2 genualae (σ), microgenuala (k), tibia 8B, 2 tibialae (ϕ), microtibiala (k); tarsus (51 \times 19) 20B, tarsala (16) (ω), microtarsals (e), subterminala (ζ), parasubterminala, pretarsala (ζ). *Leg II.* 174–186; coxa 1B; trochanter 1B; basifemur 2B; telofemur 4B; genu 3B, genuala (σ); tibia 6B, 2 tibialae (ϕ); tarsus (42 \times 18) 16B, tarsala (13–15) (ω), microtarsala (e), pretarsala (ζ). *Leg III.* 215–219; coxa 1B; trochanter 1B; basifemur 2B; telofemur 3B; genu 3B, genuala (σ); tibia 6B; tarsus (52 \times 16) 15B.

Type data. Holotype (BPBM 12,771) and 4 paratypes, TANZANIA: Dar Es Salaam, University of Dar Es Salaam campus, ex *Crocidura* sp., 2.XII.1980 (K.M. Howell).

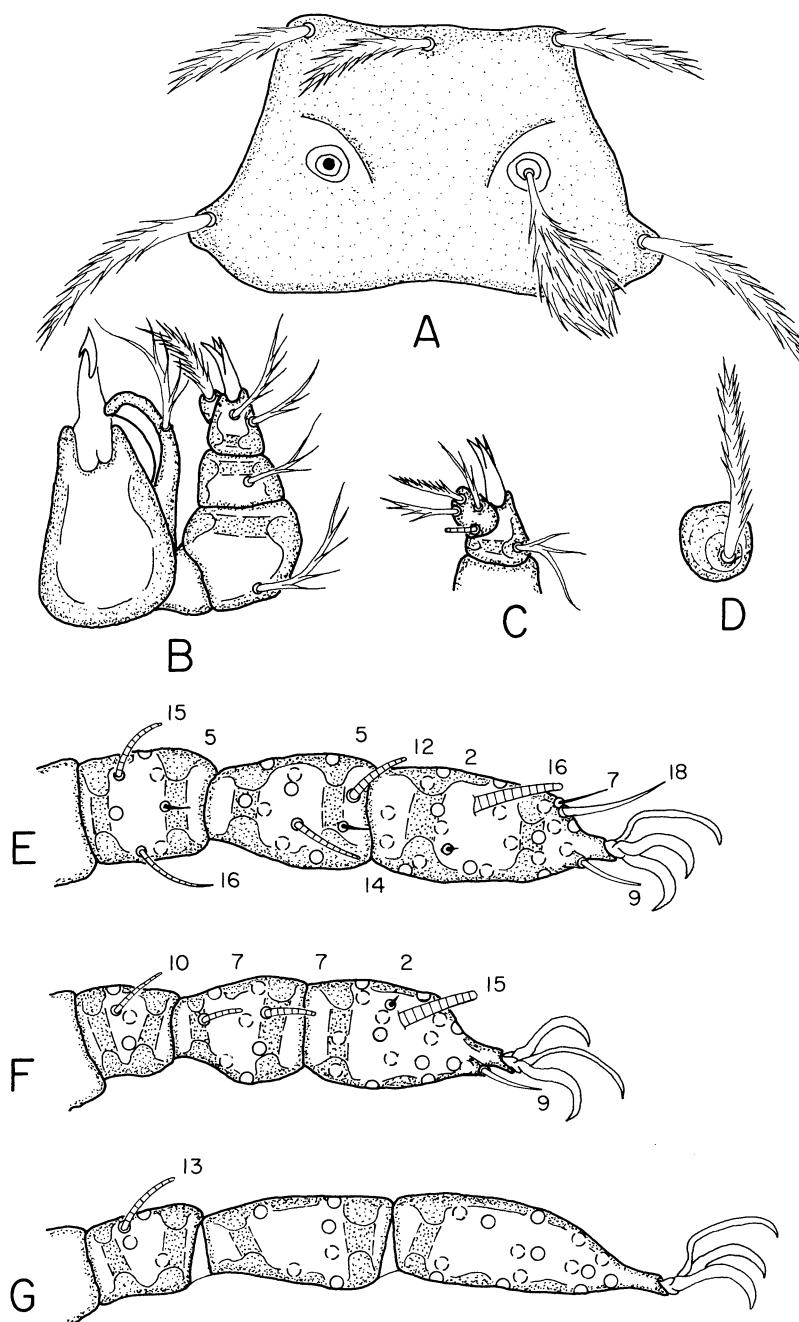

FIG. 2. *Schoutedenichia discalis*: A, scutum; B, dorsal aspect of gnathosoma; C, ventral aspect of palpal tibia and tarsus; D, dorsal idiosomal seta; E, leg I distal 3 segments showing specialized setae (measurements in micrometres) and bases of branched setae; F, leg II as above; G, leg III as above.

Remarks. *Schoutedenichia discalis* resembles *S. paulus* Vercammen-Grandjean, 1958, in having dorsal idiosomal setae inserted on circular plates, but differs in the palpal setal formula B/B/BBB/4B (N/N/NNB/4B or B/B/NNB/4B for *S. paulus*), having coxa III unisetose (3B for *S. paulus*) and the shape of the scutum. *S. discalis* may be separated from *S. fulleri* Jadin & Vercammen-Grandjean, 1954, in having dorsal idiosomal setae inserted on plates (free on cuticle in *S. fulleri*), palpal setal formula (B/ N/BNB/4B for *S. fulleri*) and number arrangement of idiosomal setae (174 idiosomal setae for *S. fulleri*).

The species name is based on the circular plates surrounding the dorsal idiosomal setae.

Acknowledgments. Thanks are extended to Dr K.M. Howell, Zoology Department, University of Dar Es Salaam, for allowing me to examine these specimens.
