Studies in the Hawaiian Rutaceae, VII

**A Conspectus of Species and Varieties and Some Further
New Taxa in the Genus *Pelea* A. Gray**

By BENJAMIN C. STONE

DEPARTMENT OF BOTANY, UNIVERSITY OF MALAYA

The genus *Pelea* is considered to consist of 75 species, of which 72 are confined to the Hawaiian Islands and 2 are found in the Marquesas. The genus is divided into four sections: *Pelea* with 4 species; *Cubicarpa* with 10 species; *Apocarpa* with 18 species; and *Megacarpa* with 43 species; if the Marquesan species are included. A conspectus of all currently recognized species, varieties, and forms is provided, with pertinent synonymy. Two new species, five new varieties, and four new forms are described, and 10 new combinations are made.

As monographic studies in the genus *Pelea* continue and a reasonably complete picture of the taxonomic size of the genus appears, the position of *Pelea* in the Hawaiian flora takes on added significance. Of the 102 proposed binomials, 75 have been retained as species; and although a few remain as doubtful or poorly known, this total probably is very nearly all of the presently existing species. One indeed may be extinct. This leaves *Pelea*, together with the genera *Bidens*, *Cyanea*, and *Cyrtandra*, as one of the most complex of the Hawaiian genera. In the present conspectus all currently accepted species are listed with subtaxa and synonyms. A few of the taxa are here described for the first time, while others represent new combinations in the same or in a different status, based on earlier described taxa. To validate these the latter portion of the paper includes brief descriptions. They will be more fully considered and illustrated in the monographic treatment.

PELEA A. GRAY

Proc. Amer. Acad. Arts and Sci. 3:4, 1854; Bot. U.S. Explor. Exped. 15(1):339, 1854; Atlas, Bot. U.S.E.E. pl. 35, 38, 1856.

PART II. DESCRIPTIONS OF NEW TAXA IN THE CONSPECTUS
Sect. PELEA*Pelea clusiaefolia* A. Gray var. *crassiloba* B. C. Stone, var. nov.

Arbor glabra (sed innovationibus minute pubescentibus) a variate *clusiaefoliae* typicae in exocarpiis crassioribus (1.5 mm. non 0.5 mm.) magnioribus (15 mm. diam.) differt; lobis duri-lignosis rugulosis in sicco; seminibus 5 mm. vel 6 mm. longis. Foliis longe

158 *B. P. Bishop Museum—Occasional Papers XXIII, 10, 1966*

petiolatis, in base obtusis fere valde oblongis utrinque glabris vel squamosis ad costis.

Holotype: Oahu, Waianae Range, ridge trail to Palikea, July 2, 1947, R. S. Cowan 667 (BISHOP). Isotype in US.

Distribution: Oahu, chiefly in the Waianae Range.

Pelea clusiaefolia var. *crassiloba* f. **Degeneri** B. C. Stone, forma nova.

Folia spathulata, basi subcordata, innovationibus puberulentibus; costa infra puberula.

Holotype: Maui, north and inland of Ulupalakua, in small ash-cinder crater, July 4, 1927, Degener 8553 (BISHOP).

Distribution: Maui.

Pelea clusiaefolia var. *cuneata* f. **aurea** B. C. Stone, forma nova.

Innovationibus aurei-pubescentibus pilibus dense confertis adpressis, foliis deinde glabrescentibus.

Holotype: Hawaii, rain forest above Hilo along Honolii stream 700 m. alt., Nov. 13, 1926, MacDaniels 247 (BISHOP).

Distribution: Hawaii.

Pelea clusiaefolia subsp. *Cookeana* var. *Cookeana* f. **longipes** B. C. Stone, forma nova.

Petiolis 2-4 cm. longis, laminis basi subcordatis vel cordatis, foliis in verticillis 4-5, innovationibus puberulentibus vel hirsutulis, floribus a var. typica similibus, capsulis ignotis.

Holotype: Molokai, Kalae, June, 1912, Forbes 79, Mo. (BISHOP).

Distribution: Lanai and Molokai.

Pelea haleakalae B. C. Stone, sp. nov. (Sect. *Pelea*). [Fig. 1.]

Arbor, innovationibus glabrescentibus; verticillis 4-foliatis, foliis obovatis vel spathulatis vel anguste obcordatis apice rotundato vel emarginato basim cuneata vel decurrente, 6-10 cm. longis, 3-5 cm. latis, glabris, valde coriaceis, petiolatis, petiolo 10-15 mm. longo; floribus femineis 12-14 mm. longis, sepalis carnosus ad basim 2 mm. crassis imbricatis, petalis bis longioribus carnosus; capsula 12-13 mm. diametro $\frac{1}{2}$ -lobata lobis globosis, sepalis (interdum petalis) persistentibus; exocarpiis tenuibus.

Holotype: Maui, Kula trail to Waikamoi, Aug. 6-7, 1919, Forbes 1277, M. (BISHOP).

Distribution: Maui, endemic around Haleakala at moderate elevations.

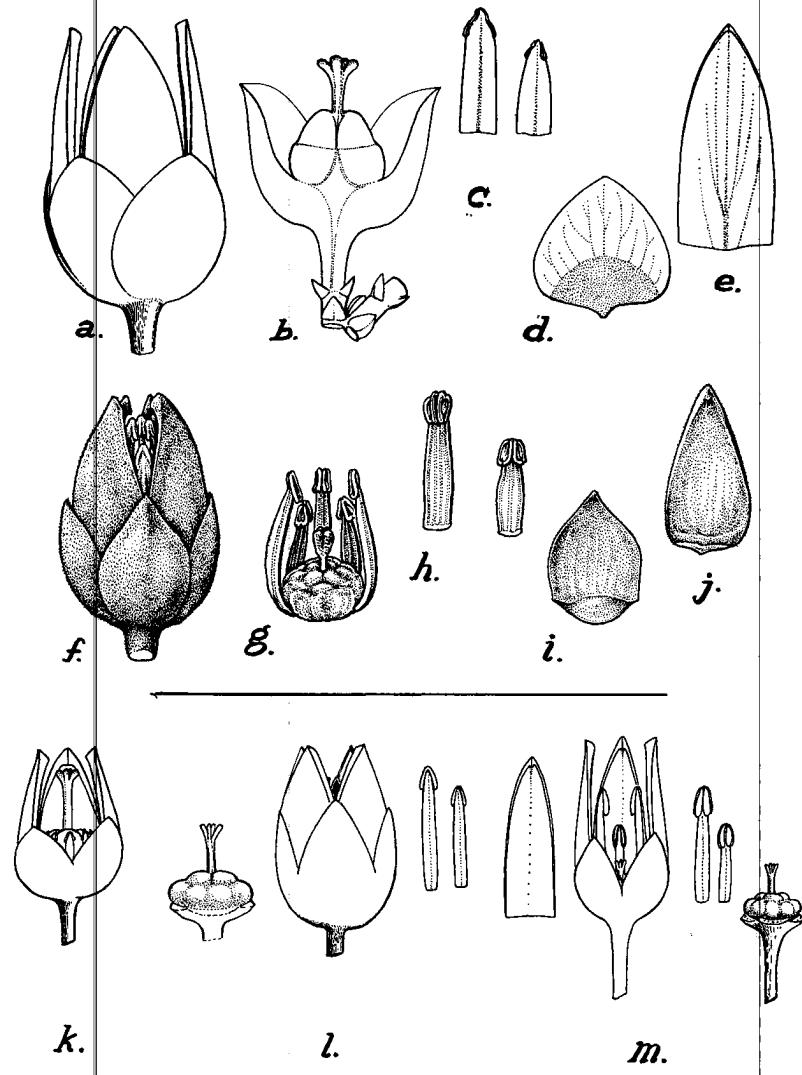

FIGURE 1.—*Pelea haleakalae* B. C. Stone; flowers and floral parts. a, Female flower; b, the same, in section, with petals removed; c, the same, showing one stamen from the two unequal quartets; d, the same, a sepal, inner face, the lower stippled portion adnate; e, the same, a petal, inner face. (a-e, all from Scheuer & Werny, Maui.) f, Male flower; g, the same, showing ovary and five of the 8 stamens; h, the same, showing one stamen from the two unequal quartets; i, the same, a sepal, inner face; j, the same, a petal, inner face. (f-j, all from Lane, Maui.)

Pelea clusiifolia A. Gray. A series of flowers for comparison with those of the above species. k, Female flower (Horigan, Pupukea, Oahu). l, Male flower, with parts (Stone 2803, Pupukea, Oahu). m, Male flower (Chang in 1932, Kipapa, Oahu).

All figures $\times 2\frac{1}{2}$.

This species is very closely related to *P. clusiaeifolia*, from which, however, it differs markedly in the much larger flowers with their strongly thickened sepals that are persistent on the mature capsule; and also in the spathulate and decurrent leaf-blades. The specific epithet is derived from the name of the magnificent inactive volcano, Haleakala.

Sect. MEGACARPA

Pelea rotundifolia A. Gray var. *rotundifolia* f. **ternata** B. C. Stone,
forma nova.

Folia tres in verticillis.

Holotype: Oahu, Punaluu, Castle Trail, August, 1959, B. C. Stone 3905 (BISHOP).

Distribution: Oahu.

Pelea volcanica A. Gray var. **kohalae** B. C. Stone, var. nov.

Innovationibus fulvo-tomentellis, deinde glabrescentibus; foliis oppositis, petiolis 10-14 mm. longis, laminis 3-7 cm. longis, 3-5 cm. latis, late ellipticis vel fere rotundatis coriaceis; inflorescentiis axillaribus 1-5-floriferis axibus tenuibus elongatis, pedunculo 7-12 mm. longo; capsulis magnis 38 mm. diam., 12 mm. altis lobis subrecurvatis 2/3 separatis, exocarpis c. 2 mm. crassis, glabratris (sed ovario tomentello), endocarpis glabris, seminibus c. 9 × 5 mm.

Holotype: Hawaii, Kohala Mountains, Awini, common near summit, small tree or shrub, June, 1910, J. F. Rock 8992 (BISHOP). Isotype at A.

Distribution: Hawaii, Kohala Mountains.

A well-marked variety, notable for the slender filiform and few-flowered elongated cymes, and relatively small rotund leaves.

Sect. CUBICARPA

Pelea anisata H. Mann Jr. var. **haupuana** B. C. Stone, var. nov.

Frutex arborescens, innovationibus minute fulvo-puberulentibus, glabratris; foliis oppositis, petiolis crassis 1-2.5 cm. longis, in maturitate base lenticellati, laminis late ellipticis vel elliptico-vel rotundo-ovatis, in base subcordatis, in apice rotundatis vel emarginatis, laminis 4-13 cm. longis, 3-8 cm. latis; inflorescentiis axillaribus trifloriferis, axibus glabris 1-3 mm. longis, bracteolis late ovatis; floribus masculis sepalis c. 2.3 × 2.3 mm., petalis c. 7 × 3 mm.; staminibus fertilibus inaequalibus, 4 staminibus ad petala aequantibus, 4 quam petalis brevioribus; ovario glabro; disco glabro; stylo glabro, 1.3 mm. longo,

stigmate 0.7 mm. lato; floribus femineis quam flori masculi brevioribus; capsulis subcuboideis 14 mm. latis, glabris, endocarpio glabro.

Holotype: Kauai, Haupu Mountain near summit, 2,280 ft. alt., Dec. 31, 1956, B. C. Stone 1626 (BISHOP). (Male.)

Distribution: Restricted to the Haupu Range on Kauai.

Sect. APOCARPA

Pelea cinerea (A. Gray) Hillebr. var. *mauiana* B. C. Stone, var. nov.

A var. *cinerea* in disco hypogyno puberulento differt.

Holotype: Maui, without definite locality, *Jules Rémy* 625, 1851-55 (PARIS).

Distribution: Maui, known only from the type.

Pelea cinerea var. *Skottsbergii* B. C. Stone, var. nov.

A var. *cinerea* in axibus inflorescentiae glabris resinosis differt.

Holotype: Oahu, Koolau Range, Manoa Valley, 300-400 m. alt., August 18, 1922, C. Skottsberg 242 (GOTH). Isotype in BISHOP.

Additional specimen examined: Oahu, Kalihi, Oct. 1909, *Faurie* 181 (A).

Distribution: Oahu, Koolau Range.

ADDENDUM

After the manuscript of the Conspectus was sent to the printer, the presence of a further species of *Pelea* was discovered. It is described and illustrated below.

Pelea Degeneri B. C. Stone, sp. nov. (Sect. Cubicarpa). [Fig. 2.]

Frutex; folia opposita; novellis fulvo-tomentellibus; foliis ellipticis petiolatis, petiolo 15-25 mm. longo et ad 4 mm. crasso tomentello; laminis 8-9 cm. longis 2-6 cm. latis, superne in sulco costali tomentellis sed glabratis, inferne tomentellis praecipue ad costam; floris ignotis; inflorescentiis cymosis 2 cm. longis, trifloriferis, pedunculo 5 mm. longo, pedicello primo 5 mm. longo, pedicello secondo 3 mm. longo; nodis cymorum bibracteolatis; capsulis glabris cuboidalis 9 mm. altis 9 mm. latis loculis uniseminatis, endocarpio glabro; semina prope matura 4.5 mm. longa nigra.

Holotype: Kauai, along Kokee stream in rain forest, June 30, 1926, Otto Degener 8531 (BISHOP). Isotypes at CATH and NY.

Distribution: Known only from Kauai.

An early study of this specimen suggested that it might be the still imperfectly understood *Pelea waimeaeensis*; but a growing familiarity with some of the limits of variation, especially in capsule structure,

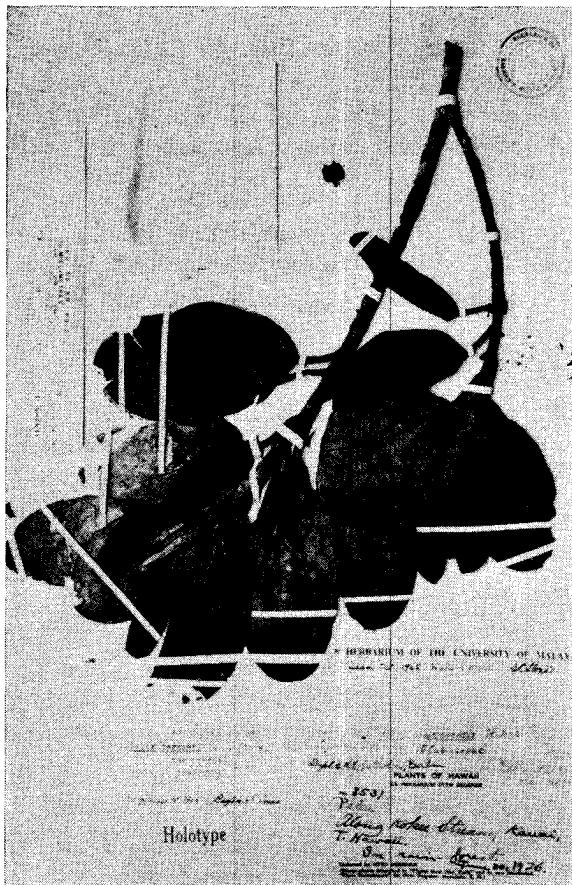

FIGURE 2.—*Pelea Degeneri* n. sp. Photo of holotype (Kauai: Degener 8531) in the Bishop Museum Herbarium.

made it clear that the above specimen represented a distinct new species, related to *Pelea anisata*, but with dense fulvous tomentum. *Pelea waimeaeensis* has flattened, quadrate capsules, a feature that suggests a relationship to *Pelea peduncularis*; while the capsules in *Pelea Degeneri* are cuboid.

It is a pleasure to dedicate this overlooked species to the well-known author of the *Flora Hawaïensis*, Dr. Otto Degener, of Waialua, Oahu.

This species brings to 75 the total number in the genus. It should be inserted after No. 46 (*P. anisata*) in the above list.
